

InfraSight

Dashboard User Guide (Simple)

Getting around

- Use the left sidebar to navigate: Dashboard, Devices, Telemetry, Predictions, Alerts, Scenarios, Evaluation, Settings.
- Click a device name anywhere to open its detail page.
- Look for clear labels: Normal or At Risk.

Quick start

- Open Dashboard to see overall health, top alerts, recent predictions, and trends.
- If something is At Risk, click through to investigate the device.
- Use Alerts to acknowledge or resolve issues and track status.

Dashboard

- KPI cards: quick counts for devices, active alerts, and recent predictions.
- Devices: list of monitored assets with current state.
- Alerts & Predictions: summaries of what needs attention now.
- Trend: recent prediction risk trend to spot patterns.

Devices and Device Detail

- Devices: browse and search for an asset; click to open its details.
- Device Detail: see current health, recent telemetry window summary, and latest prediction.
- Actions (demo mode): Simulate Telemetry to create fresh readings; Run Prediction to update risk.

Telemetry

- Live table of recent readings (CPU, Memory, Disk, Packet Loss, Latency, Errors, Restarts, Uptime).
- Used to build short time windows for model input.
- Check timestamps and values when investigating spikes.

Predictions

- List of recent predictions with predicted class (Normal / Fault■Prone) and confidence.
- Model info includes feature importance and evaluation summary.
- Use as decision support; combine with alerts and telemetry.

Alerts

- Filter by severity and status to focus on what matters.
- Open an alert to view details and recommended action.
- Acknowledge or Resolve once addressed to keep the queue clean.

Scenarios and Evaluation

- Scenarios: run demo fault patterns to validate detection and prediction.
- Evaluation: view metrics and export a report for documentation.

Settings

- Update basic preferences and review system information.
- If running in demo/mock mode, some actions will simulate data.

Tips

- Start at Dashboard, drill down via Devices, confirm via Telemetry, act via Alerts.
- Look at confidence and recent trend to avoid false positives.
- Use Evaluation export for summaries in reports.

Glossary (plain language)

- Normal: device looks healthy.
- At Risk / Fault■Prone: device shows patterns linked to faults.
- Confidence: how strongly the model believes the prediction.
- Severity: how urgent an alert is.
