

InfraSight

ICT Fault Detection and Predictive Maintenance

- Monitors device health and finds early warning signs.
- Predicts fault risk and sends clear, actionable alerts.
- Reduces downtime and firefighting across ICT operations.

How it works

- Collect: Devices send routine signals like CPU, memory, and network loss.
- Organize: Readings are grouped into short time windows.
- Predict: A model looks for patterns linked to potential faults.
- Alert & act: If risk is high, the system flags the device and recommends next steps.

Value and next steps

Value

- Fewer incidents and faster response times.
- Clear priorities for support teams.
- Evidence for continuous improvement.

Example

- A router's packet loss and errors creep up; InfraSight predicts 'At Risk' and suggests checking the link or reseating a cable—so the team fixes it before an outage.

What's next

- Tune alerts to your environment.
- Add more device types and fault scenarios.
- Integrate with your ticketing workflow.
